## Wrapper

Being the wrapper class, it's deciding how porous S.A. is.

In this case it prevents inputs violating the Ascending order from continuing.

## Operation:

```
public boolean Ascend(int limit) {  
    if (-Size[i] > limit) {  
        return false;  
    }  
    else {  
        return true;  
    }  
}
```

if we are interpreting this classes function correctly,

Another longer method may be the ordering of the given inputs in ascending order to return true.

Failure in this case, prevents access to S.A. functionality.
